

In-Class Activity 7-1 Questions

Script Parsing

1. In motor.html, move the `script` element into the `head`. Reload the page and test the three buttons again. What do you observe?

After moving the `script` element into the `head`, I noticed that the script was no longer functioning within the html file.

2. Open the Developer Tools, check the "Console" output, what do you observe? Why?

After checking the "Console" output I found this `Uncaught TypeError: "Cannot read properties of null (reading script.js:2 'addEventListener')"`. This was most likely caused by the fact that the script being located in `head` runs too early, because the **DOM** hasn't been built yet.

3. Add "defer" in the `script` element. Reload the page and test the buttons again. Check the "Console" output. What do you observe? Why?

The buttons now work, there is no longer a `Uncaught TypeError` printed in the console. This is because `defer` delays execution until after HTML parsing is finished. So now the elements exist when the javascript runs.

Javascript

4. Download `tinyscript.zip`, run the code, study the code, and improve the code. Center the box, center the heading "**Hello Friends!**", add "." at the end of the date, send today's date to `javascript console` and check it using **developer tools**, move the script to an external file and import it using:
 - `<\script type="text/javascript" src="your file"></\script>` (remove \)
